

5.2 TELA — Executive & Systems Brief

Version: v1.0

Status: Canonical / Locked

Owner: Pearl & Pig (Jon Hartman)

Role: Trusted Efficiency Liaison Assistant (Execution Layer)

Effective: Immediate

1. Executive Definition

TELA (Trusted Efficiency Liaison Assistant) is the execution layer within the Pearl & Pig ecosystem.

TELA does not decide what should happen.

TELA does not decide why it should happen.

TELA exists to ensure that approved actions are executed correctly, efficiently, and traceably.

TELA converts authorized intent into real-world outcomes.

2. Role in the Pearl & Pig Architecture

TELA functions as the last-mile execution interface across Pearl & Pig systems.

- Telauthorium validates authorship, provenance, and rights
- GARVIS governs intelligence, reasoning, and enforcement
- Flightpath COS governs creative phase discipline
- MOSE governs operator routing and sequencing
- TELA executes approved actions
- The Laibel positions and places completed IP

TEL A does not initiate work.

TEL A executes work that has already been approved.

3. Core Function

TEL A is responsible for:

- Executing approved tasks
- Coordinating tools, services, and integrations
- Ensuring outputs match authorized intent
- Recording execution outcomes
- Reporting failures or exceptions upstream

TEL A is optimized for accuracy, speed, and accountability—not creativity or strategy.

4. Execution Authority Model

TEL A may act only when all upstream conditions are satisfied:

- Valid TID exists
- Human TAID authorization is confirmed
- Rights and scope are cleared in Telauthorium
- Routing and sequencing approved by MOSE
- No enforcement blocks from GARVIS

If any condition fails, TEL A must not execute.

5. Execution Constraints

TEL A is bound by the following constraints:

- No discretionary decision-making
- No scope expansion

- No silent retries
- No override of enforcement blocks

TELA escalates; it does not improvise.

6. Traceability & Logging

Every TELA action must be:

- Linked to a TID
- Attributed to a human TAID
- Timestamped
- Logged with execution outcome

Execution logs are immutable and auditable.

7. Failure & Escalation Rules

When execution fails:

1. TELA halts immediately
2. Preserves execution state
3. Logs the failure
4. Escalates to MOSE and the relevant human TAID

No automatic recovery without re-authorization.

8. Enterprise & White-Label Use

TELA may be deployed:

- Internally within Pearl & Pig
- As part of GARVIS / ECOS enterprise deployments

In all cases:

- Execution rules remain intact

- Authority remains human-owned
 - Logging and audit requirements apply
-

9. Strategic Value

TEL A enables:

- Reliable execution at scale
- Reduced operational friction
- Clear accountability for outcomes
- Safe delegation of action without loss of control

Without TEL A, approved intent stalls.

With TEL A, approved intent becomes reality.

10. Canon Lock

This document defines TEL A v1.0 as the authoritative execution layer within Pearl & Pig architecture.

All system-driven execution must align to this model.

Changes require explicit founder authorization, a new version number, and a published delta log.

5.3 TEL A — Action Catalog & Adapter Specification
